GFA and GFAS Gear Couplings

Coupling types GFA and GFAS are designed for heavy industrial applications, providing a torsionally stiff connection of shafts which can accommodate angular and parallel misalignment and axial movement.

The GFA coupling consists of two hardened steel hubs with external crowned and barrelled gear teeth, connected by a hardened steel sleeve with matching gear teeth. The hub teeth are positioned a maximum distance apart to minimise angular and parallel misalignment. The double articulation in the GFA series permits high misalignment.

The GFAS coupling has only one hub with external teeth, which connects to a sleeve with integral hub, to reduce weight and inertia. This series provides a stiffer connection, particularly suited to cardan shaft applications. Hubs and sleeves are produced from high strength steel (800N/mm² tensile strength) with chemical surface-hardening to enhance wear and corrosion resistance, and avoid seizure. All teeth are to DIN 3992 Class 7 accuracy, with

surface finish 1.4µm Ra. Lubrication is retained by sprung loaded seals which also prevent ingress of contaminants to ensure long operating life. Re-lubrication is via two grub screws positioned on the sleeve.

Couplings are offered with two hub lengths; standard hub suitable for most applications, and long hub for shafts of standard series motors. Hubs of different lengths can be combined in one coupling (GFA type) with refs. modified as below:-- Has two std. hubs. GFA GFAL - Has one long and std. hub.

- GFALL Has two long hubs.
- GFAS Has std. length hub. GFASL Has long length hub.

Moments of inertia refer to standard couplings bored to maximum bore size.
For operating speeds in excess of 3,600 rpm couplings should be balanced in accordance with ISO 1940 to class G2.5.
Weights are for unbored coupling hubs - total weight is the addition of two hubs plus sleeve (GFA), or sleeve plus hub (GFAS).

(1) Stock hubs are all unbored, but can be modified to customer's bore and keyway requirements, up to maximum bores indicated.

(2) Dimensions G, M, S, and T relate to couplings correctly positioned on shafts. For GFAS 25 dimension D on hub only is 40mm, and dimension F is 70mm.
